EXCERPTA MEDICA Sec 9 Vol 13/6 Surgery June 59.....
3305. MEGACOLON AND ITS TREATMENT IN CHILDREN (Russian text) -
Doletskii S. Ya. - VESTN. KHIR. 1958, 80/5 (91-98) illus, 7
Megacolon in a child is always associated with a deficiency of parasympathetic
ganglia in Auerbach's plexus of the large intestine which is more marked distally.
The predominance of the tonicity of the sympathetic plexus over the not completely
developed parasympathetic plexus, results in a continuous local spasm of the recto-
sigmoid with consequent dilatation of the large intestine. Therefore, a medical
treatment must be applied with the aim of giving to neuromuscular centres of the
large intestine the required time to adjust their function to the condition of an ab-
spastic segment should be done, leaving the dilated portion of the large intestine
alone. Experiences with 30 children with various diseases of the large intestine
are described.

TITLE: Investigation of thermoelectric cells for experimental measurements of temperatures ¹⁴ _{9M}

SOURCE: Jaderne energie, no. 1, 1966, 20-21

TOPIC TAGS: temperature measurement, thermoelectric equipment, thermocouple, nuclear reactor component

ABSTRACT: The article is an abstract of the authors' report No Ae 641/Dok. Models of thermoelectric thermocouples were used to measure temperatures of reactor parts subjected to stresses. The sensing elements are protected by perforated ceramic tubes 8 x 1 mm in diameter. Special heads were designed for the connection of long sensing elements. The testing of the elements is done by CO₂. [JPRS]

Title : Comparative Assessment of Usual Smokehouses with Smoke-
houses Provided with Isolated Smoke Generators.

Orig Pub : Prumysl potravin, 1957, 8, No 10, 518-521

Abstract : Smoking and roasting in generator smokehouses guarantees
a higher quality of products, because their taste and
aroma improve together with it. The optimum temperature
of smokehouse smoke and air is 80 to 90°. If the tempe-
rature is above 80° inside the product, the meat quality
will deteriorate: its biological value will decrease,
some amino acids will decompose, a more far reaching
denaturation of proteins will take place. The energy
consumption is decreased to 50% as compared with

smokehouses of the old type. The output rises from 200 to 600 kg per shift. The duration of smoking decreases in consequence of a better heat exchange, increased speed of air and smoke flows, as well as increased air moisture in the smokehouse. In consequence of the elimination of fireboxes, space economy is achieved in smokehouses. The productivity of work rises by 120% as compared with ordinary smokehouses. The effect of smoking method on the contamination of products with bacteria was studied.

 TITLE : Methods for the Determination of Phenol and Aldehyde in Cured Meats
 ORIG. PUB. : Prumysl Potravin, 9, No 11, 609-611 (1958)
 ABSTRACT : The applicability of various methods for the determination of phenols and aldehydes in cured meats is discussed. The author recommends the separation of the above compounds by distilling the ground samples with H_2SO_4 in a stream of CO_2 . Phenols are determined in the condensate by the method of Gjebs [?] with dibromoquinonechlorimide (blue color change). Cured meats contain 0.5-0.6 mg % of phenolic compounds (calculated on a phenol basis). For the determination of aldehydes, the

Title : Utilization of Forest Types in Improving Forest Economy.

Orig Pub: Sbor. Ceskosl. akad. zemed. ved. Lesn., 1955, 28, No 2, 211-218

Abstract: The enormous significance of forest typology and the proper selection of planting types in forestry is noted. It is pointed out that for complete utilization of forest typology in the external spatial forest structure, an imperfect knowledge of economic compatibility of plantation types hinders the determination of stable economic units and economic classes. A general pattern is furnished for the practical utilization of forest typology in the Czechoslovakian forest economy.
